

Nontuberculous Mycobacterial Infections

CHARLES L. DALEY, MD

CHIEF, DIVISION OF MYCOBACTERIAL & RESPIRATORY
INFECTIONS, NATIONAL JEWISH HEALTH

PROFESSOR, DEPARTMENT OF MEDICINE

NATIONAL JEWISH HEALTH, UNIVERSITY OF COLORADO,
ICAHN SCHOOL OF MEDICINE AT MT. SINAI

Disclosures

Consultant: Genentech, Pfizer

Advisory Board Member: AN2, AstraZeneca, Hyfe, Insmed, MannKind, Matinas BioPharma Holdings, Inc., Paratek Pharmaceuticals, Spero Therapeutics, Zambon

Data Monitoring Committee: Ostuka Pharmaceutical, Eli Lilly and Company, Bill and Melinda Gates Foundation

Contracted Research: AN2 Therapeutics, Bugworks, Insmed, Juvabis, Pharmaceuticals

Learning Objectives – at the end of this talk participants should be able to:

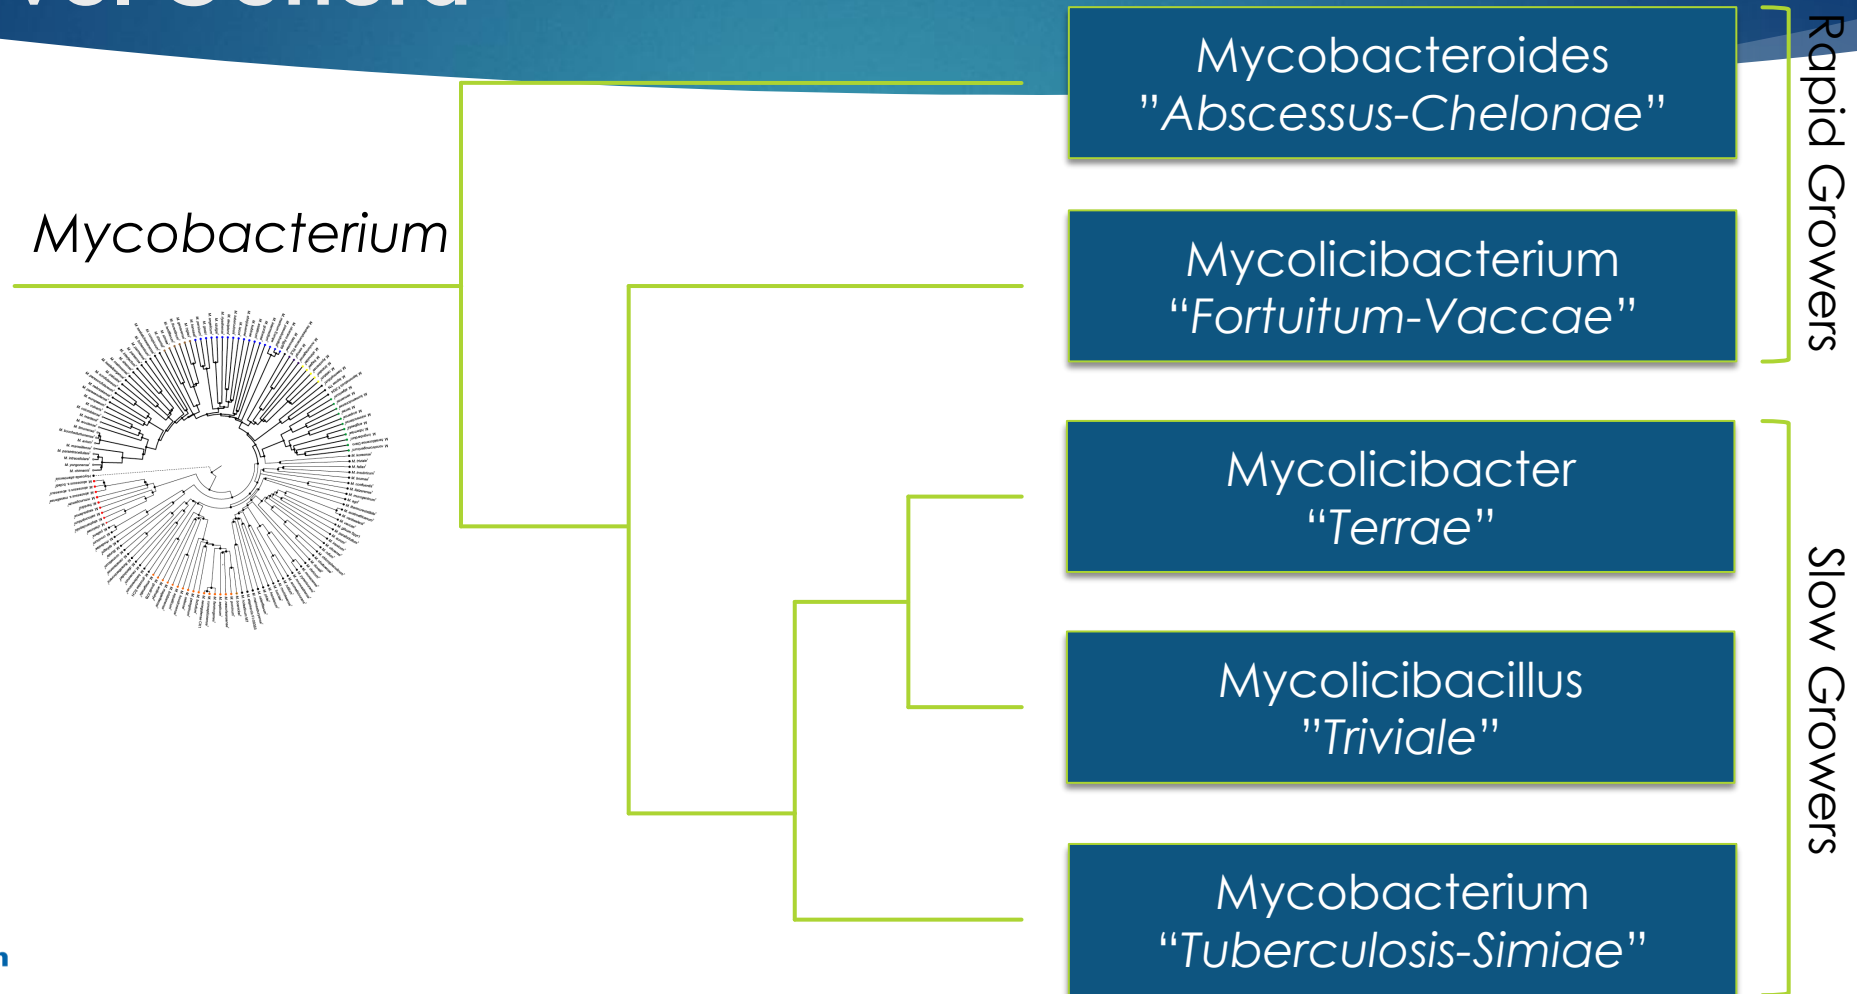

- ▶ Understand the epidemiology and clinical manifestations of NTM-PD, as well as risk factors for the disease
- ▶ Explain guideline-based diagnostic criteria and importance of the laboratory in the diagnosis of NTM-PD
- ▶ Describe current guideline-based treatment regimens for MAC-PD, including refractory disease and *M. abscessus*
- ▶ Review new and repurposed drugs in the drug development pipeline

Nontuberculous Mycobacteria (NTM)

- ▶ Environmental bacteria
- ▶ Found in soil and water
- ▶ Produce both pulmonary and extrapulmonary disease
- ▶ Pathogenicity varies greatly
- ▶ High levels of in vitro resistance
- ▶ Treatment is complex and associated with suboptimal outcomes

Division of Genus *Mycobacterium* into Emended Genus *Mycobacterium* and Four Novel Genera

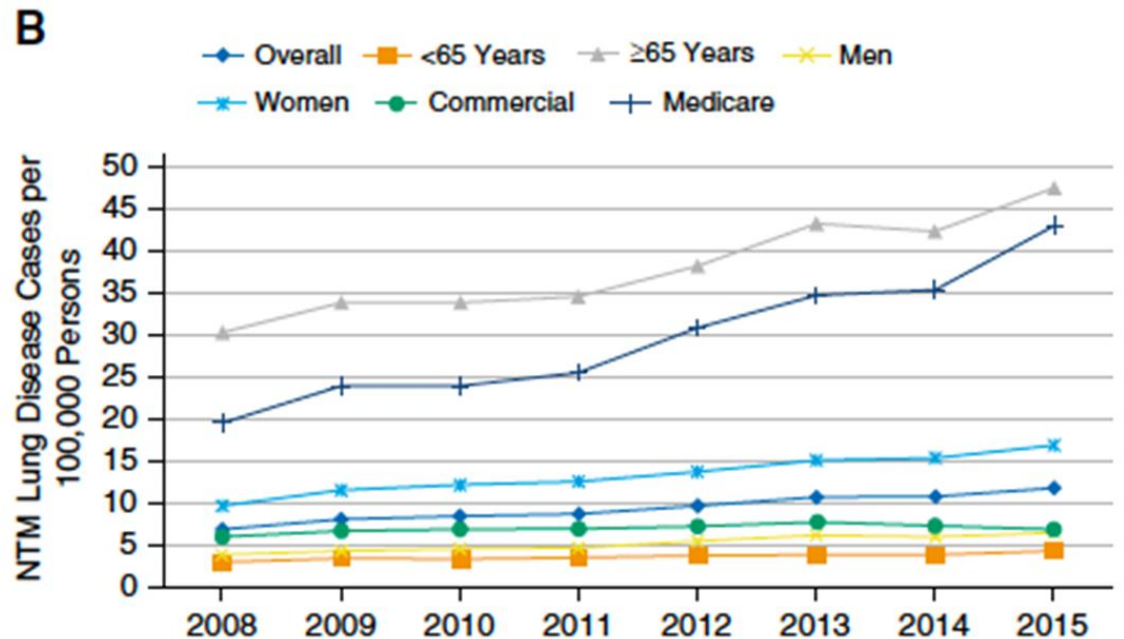

Nontuberculous Mycobacteria (NTM)

High Prevalence of NTM-PD and Increasing

- ▶ NTM prevalence is highest in older ages and women
- ▶ NTM prevalence is higher than TB in many countries
- ▶ Bronchiectasis is the greatest risk factor for NTM pulmonary disease
- ▶ NTM pulmonary disease is increasing in prevalence in many areas

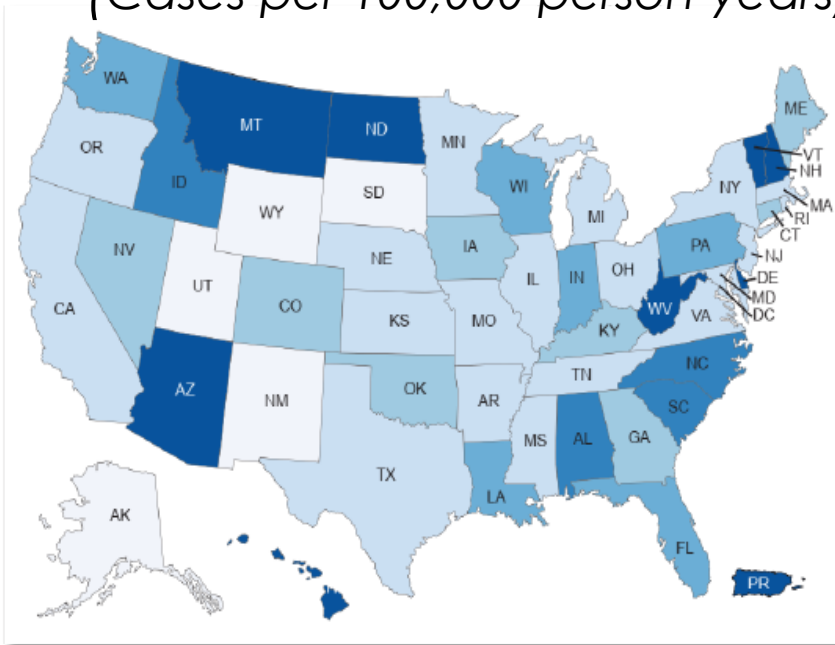

National Managed Care Claims Database – 27 million people annually

Prevalence (per 100,000)

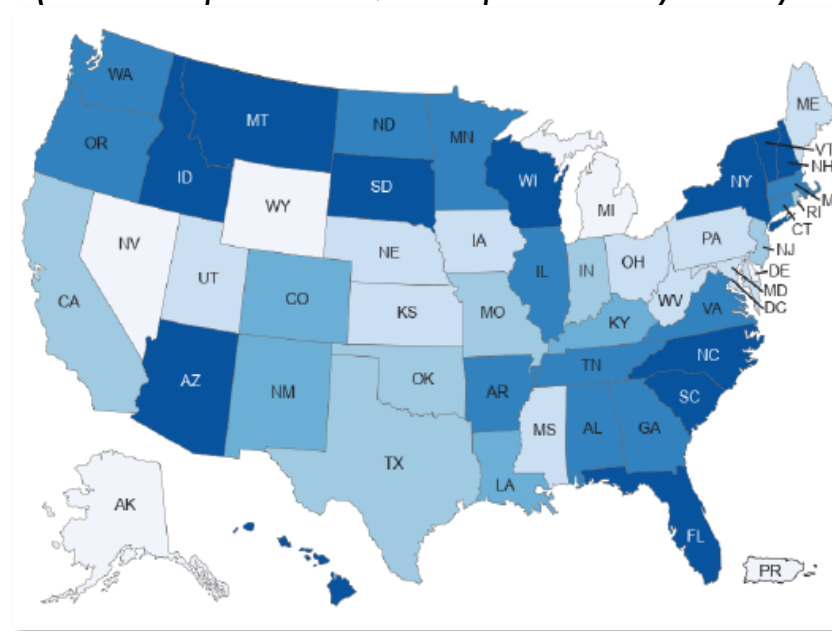

Increasing NTM US Incidence, 2008-2015

NTM INCIDENCE, 2008
(Cases per 100,000 person-years)

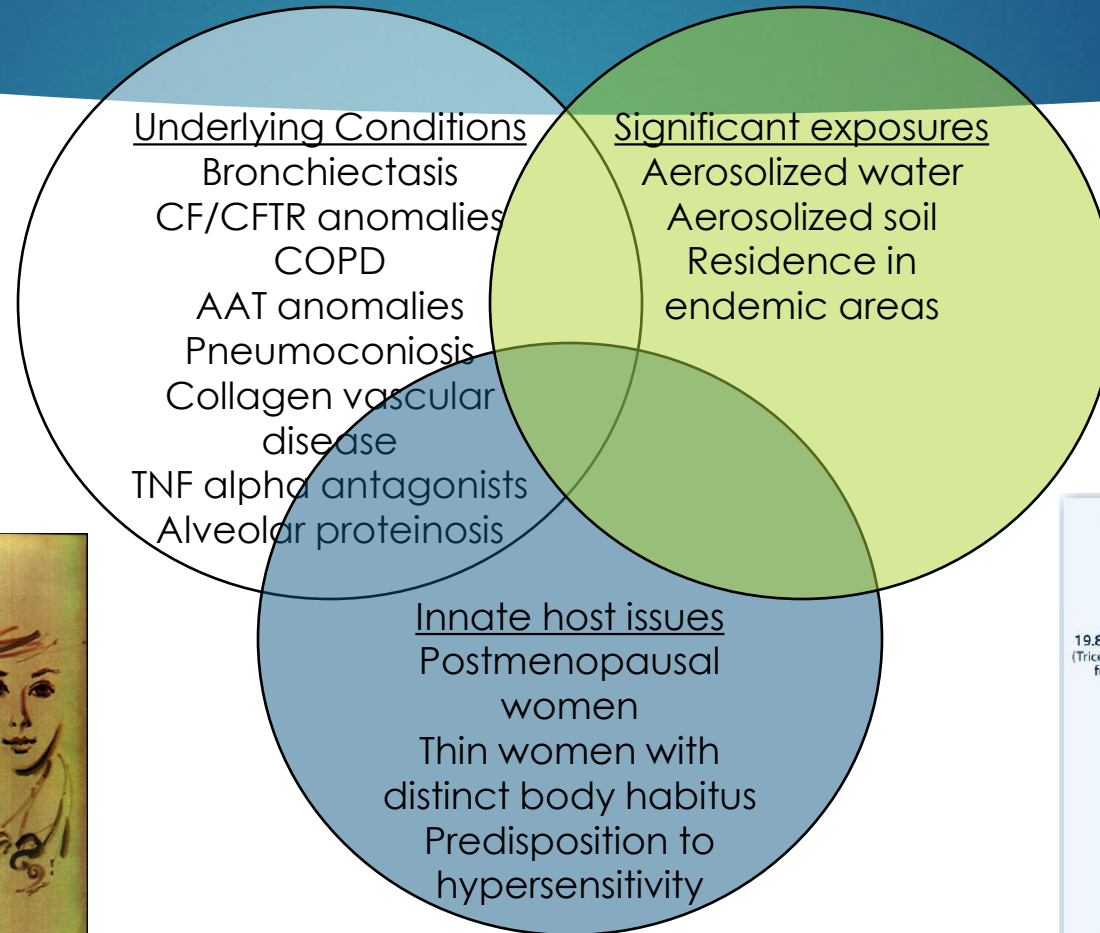

NTM INCIDENCE, 2015
(Cases per 100,000 person-years)

Winthrop KL, et al. *Ann Am Thorac Soc.* 2020;17(2):178-185.

The Host - Risk Factors for NTM Infection

Chan E and Iseman MD. Gender Med 2010;7:5-18
Kim, et al. AJRCCM 2008;178:1066

Clinical Phenotypes

▶ Nodular / bronchiectatic disease

- ▶ Women
- ▶ Older
- ▶ Nonsmokers
- ▶ Tall, thin, low body mass index

▶ Fibrocavitary disease

- ▶ Male
- ▶ Older
- ▶ Smokers
- ▶ Various body builds

Specimen Collection

Bronchoscopy specimens

- ▶ Not as good as you think
 - ▶ Lidocaine is bacteriostatic
 - ▶ Specimen is dilute
 - ▶ Sampling error
 - ▶ Unable to determine bacterial load
 - ▶ Risks
 - ▶ Costs

Sputum

- ▶ Better than you think
 - ▶ Multiple specimens – 3 over at least one week, preferably over weeks
 - ▶ Sputum AFB smear positivity and number of cultures are associated with progression of NTM disease
 - ▶ Similar culture yield as bronchoscopy in TB and NTM*
 - ▶ Induction with hypertonic saline is easy!
Patients can do it at home

* Ikeda Y. Kurume Med J. 2001;48:15-9.

NTM Pulmonary Disease: Diagnostic Criteria

Clinical	Pulmonary or Systemic Symptoms	Both required
Radiological	Nodular or cavitary opacities on chest radiograph or HRCT that shows bronchiectasis with multiple small nodules	
Appropriate exclusion of other diagnoses		
Microbiological	<p>1. Positive cultures from <u>at least two separate sputum samples</u>. If the results are nondiagnostic, consider repeat repeat sputum AFB smears and cultures</p> <p>or</p> <p>2. Positive cultures from at least one bronchial wash or lavage</p> <p>or</p> <p>3. Transbronchial or other lung biopsy with mycobacterial histologic features (granulomatous inflammation or AFB) and positive culture for NTM or biopsy showing mycobacterial histologic features (granulomatous inflammation or AFB) and one or more sputum or bronchial washings that are culture positive for NTM</p>

Multi-society NTM Treatment Guidelines

1990

DIAGNOSIS AND TREATMENT OF DISEASE CAUSED BY NONTUBERCULOUS MYCOBACTERIA

This consensus document was prepared by the American Thoracic Society and was approved by the ATS Board of Directors, March 1990.

Contents

- Epidemiology/Pathogenesis
- Clinical Presentation and Diagnostic Criteria
- Laboratory
- Treatment of Aseptic Disease
- Health Care Workers
- Management of Healthy Carriers
- Antibiotic Therapy
- Treatment of Aseptic Disease
- Treatment of Other Nontuberculous Mycobacterial Pulmonary Disease
- Management of Drug Toxicity

Introduction

This is the first official statement of a diagnostic and therapeutic approach that has been developed by a multi-society group. This topic was previously considered in the consensus document "Diagnosis and Classification of Tuberculosis and Other Mycobacterial Diseases," published in 1981. This document was published in 1981. This document was published in 1981. This document was published in 1981.

1997

American Thoracic Society
MEDICAL SECTION OF THE AMERICAN LUNG ASSOCIATION

Diagnosis and Treatment of Disease Caused by Nontuberculous Mycobacteria

The Official Statement of the American Thoracic Society was Approved by the Board of Directors, March 1997

SUMMARY

Diagnosis Criteria of Nontuberculous Mycobacterial Lung Disease in HIV-seronegative and immunocompetent Patients

The following criteria apply to symptomatic patients with chronic, subacute or acute disease, or a high-resolution computed tomography scan that shows nodules, consolidation, or bronchiectasis.

1. show positive culture with negative AFB1 test results
2. no positive culture and one positive AFB1 test result
3. no positive culture and one positive AFB1 test result and 4+ growth on solid media
4. positive culture with 1+, 2+, or 4+ AFB1 test or 2+, 3+, or 4+ growth on solid media

KEY LABORATORY FEATURES OF THE NONTUBERCULOUS MYCOBACTERIA

1. Susceptible to culture. Current methods of specimen culture used for NTM infection are specific for most NTM species. The traditional method includes inoculation into 7H9 or 7H11 agar. Specialized methods are available for the identification of NTM species that are not susceptible to culture.
2. Susceptible to culture. Current methods of specimen culture used for NTM infection are specific for most NTM species. The traditional method includes inoculation into 7H9 or 7H11 agar. Specialized methods are available for the identification of NTM species that are not susceptible to culture.

The official ATS/ERS/ESCMID/IDSA clinical practice guideline is intended for use by clinicians in the management of nontuberculous mycobacterial pulmonary disease in adults.

Summary

Diagnosis Criteria of Nontuberculous Mycobacterial Lung Disease

The following criteria apply to symptomatic patients with chronic, subacute or acute disease, or a high-resolution computed tomography scan that shows nodules, consolidation, or bronchiectasis.

1. show positive culture with negative AFB1 test results
2. no positive culture and one positive AFB1 test result
3. no positive culture and one positive AFB1 test result and 4+ growth on solid media
4. positive culture with 1+, 2+, or 4+ AFB1 test or 2+, 3+, or 4+ growth on solid media

Mycobacterium avium complex - the most common NTM pulmonary pathogen

Recommended Initial Treatment Regimens for Drug Susceptible MAC Pulmonary Disease

	No. of Drugs	Preferred Regimen ^a	Dosing Frequency	Duration
Nodular-bronchiectatic	3	Azithromycin (clarithromycin) Rifampicin (rifabutin) Ethambutol	3 times weekly	12 months beyond culture conversion
Cavitary	≥ 3	Azithromycin (clarithromycin) Rifampicin (rifabutin) Ethambutol Amikacin IV (streptomycin) ^b	Daily (IV aminoglycoside may be used 3 times weekly)	

a. Alternative drugs could include clofazimine, fluoroquinolones, linezolid (tedizolid), bedaquiline

b. Consider for cavitary, extensive nodular bronchiectatic or macrolide resistant disease

Initiate Treatment or "Watchful Waiting"?

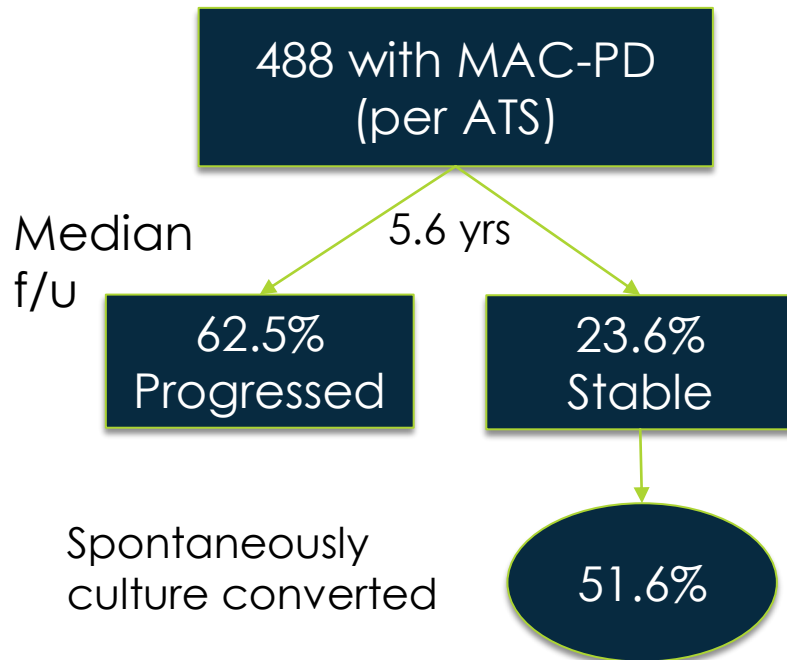

Guideline recommendation

In patients who meet the diagnostic criteria for NTM pulmonary disease, we suggest initiation of treatment rather than watchful waiting, especially in the context of positive acid-fast bacilli sputum smears and/or cavitary lung disease (conditional recommendation, very low certainty in estimates of effect). Daley CL, et al. *CID* 2020;71:5-913; *Euro Respir J* 2020;56:2000535

Initiate Treatment or "Watchful Waiting"?

Risk Factors Associated with Progression

Host/Demographic Factors

- Male gender
- Older age
- Presence of co-morbidities
- Low body mass index

Laboratory Factors

- Elevated inflammatory indices (ESR, CRP)
- Anemia
- Hypoalbuminemia

Radiographic Factors

- Fibrocavitary
- Extent of disease

Microbial Factors

- Bacterial load
- Species

Nonpharmacologic Therapy

▶ Airway Clearance

- ▶ Regular exercise
- ▶ Vibratory PEP →
- ▶ Chest percussion
- ▶ Nebulized hypertonic saline
- ▶ Chest wall oscillation →

▶ Pulmonary rehabilitation

▶ Nutrition

▶ GERD

- ▶ Lifestyle modifications

Best choice is what the patient will do

- Education
- Time commitment

Treatment Outcomes for MAC

	Culture Conversion	Microbiologic Recurrence	Reinfection
Macrolide susceptible			
Non cavitory Cavitory	70% - 80% 50% - 80%	25-48%	46-75%
Macrolide resistant			
No surgery/aminoglycoside* Some surgery/aminoglycoside Surgery + prolonged aminoglycoside*	5% 15% 80%	-	-

Treatment Refractory MAC Pulmonary Disease

Inhaled Amikacin

Guideline recommendation

In patients with MAC pulmonary disease who have failed therapy after at least six months of guideline-based therapy, we recommend addition of amikacin liposome inhalation suspension (ALIS) to the treatment regimen rather than a standard oral regimen, only. (strong recommendation, moderate certainty in estimates of effect).

CONVERT Study – Randomized, controlled study of ALIS in treatment refractory MAC pulmonary disease

Proportion of Patients With Negative Sputum Cultures for MAC

Recommended Treatment Regimens for MAC Pulmonary Disease

	No. of Drugs	Preferred Regimen ^a	Dosing Frequency
Nodular-bronchiectatic	3	Azithromycin (clarithromycin) Rifampicin (rifabutin) Ethambutol	3 times weekly
Cavitary	≥ 3	Azithromycin (clarithromycin) Rifampicin (rifabutin) Ethambutol Amikacin IV (streptomycin) ^b	Daily (IV aminoglycoside may be used 3 times weekly)
Refractory ^c	≥ 4	Azithromycin (clarithromycin) Rifampicin (rifabutin) Ethambutol Amikacin liposome inhalation suspension or IV (streptomycin) ^b	Daily (IV aminoglycoside may be used 3 times weekly)

a. Alternative drugs could include clofazimine, moxifloxacin, linezolid (tedizolid), bedaquiline

b. Consider for cavitary, extensive nodular bronchiectatic or macrolide resistant disease

c. Sputum culture positive after 6 months of guideline-based therapy

Sustainability and Durability of Culture Conversion

In patients who achieved culture conversion by month 6 in CONVERT:

- ▶ Was conversion **sustained** (negative results for 12 mos on treatment)
- ▶ Was conversion **durable** (negative results for 3 mos and 12 mos after treatment)

		% Remaining Culture Negative		
Condition	Time of Measurement	ALIS +GBT	GBT	P-value
Sustained	12 months on therapy	63.1%	30.0%	0.064
Durable	3 months after therapy	55.4%	0%	0.0017
	12 months after therapy	46.2%	0%	< 0.0001

Recommended Treatment Regimens for Treatment Refractory MAC Pulmonary Disease

- ▶ Switching from intermittent therapy to daily therapy
- ▶ Adding additional medications
 - ▶ Amikacin liposome inhalation suspension
 - ▶ Clofazimine
 - ▶ Bedaquiline
 - ▶ Oxazolidinones (linezolid, tedizolid)
 - ▶ Flouroquinolones?
- ▶ Substituting medications
 - ▶ Rifabutin (substituting for rifampin)
- ▶ Surgery

Surgery Plus Medical Therapy or Medical Therapy Alone?

Recommendation

In selected patients with NTM pulmonary disease, we suggest surgical resection as an adjuvant to medical therapy after expert consultation (conditional recommendation, very low certainty in estimates of effect)

- ▶ 15 observational studies including approximately 700 patients who underwent surgical resection including 3 studies (296 patients) that compared outcomes in those who had surgery plus antimicrobial therapy vs antimicrobial therapy alone
 - ▶ Culture conversion more common in those who underwent surgery
 - ▶ Complications in 7-35%
 - ▶ No operative mortality
 - ▶ 0-9% post-operative mortality
 - ▶ Beware of selection bias

Mycobacterium abscessus: Macrolide Resistance

Resistance to macrolides impacts treatment outcomes

Two types of resistance:

Mutational Resistance

Mutation in *rml* gene

Inducible Resistance

Erythromycin ribosomal methylase gene, *erm*(41):

M. abscessus ~ 80-90%

M. massiliense ~ 0%

M. bolletii ~ 100%

Recommended Treatment Regimens *M. abscessus* – A Phased Approach

Macrolide Susceptibility						
Mutational	Inducible	No. of Drugs	Preferred Drugs		Frequency of Dosing	Treatment Success
Susceptible	Susceptible	Initial Phase ≥3	<i>Parenteral (choose 1-2)</i> Amikacin Imipenem (or ceftazidime) Tigecycline	<i>Oral (choose 2)</i> Azithromycin* Clotrimazole Linezolid	Daily (3 times weekly may be used for aminoglycosides)	> 80%
		Continuation Phase ≥ 2	<i>Oral/inhaled (choose 2-3)</i> Azithromycin* Linezolid	Clotrimazole Inhaled amikacin		

*Azithromycin is active

**Azithromycin is unlikely to be active

Recommended Treatment Regimens *M. abscessus* – A Phased Approach

Macrolide Susceptibility						
Mutational	Inducible	No. of Drugs	Preferred Drugs		Frequency of Dosing	Treatment Success
Susceptible	Susceptible	Initial Phase ≥ 3	<i>Parenteral (choose 1-2)</i> Amikacin Imipenem (or ceftazidime) Tigecycline	<i>Oral (choose 2)</i> Azithromycin* Clofazimine Linezolid	Daily (3 times weekly may be used for aminoglycosides)	> 80%
		Continuation Phase ≥ 2	<i>Oral/inhaled (choose 2-3)</i> Azithromycin* Clofazimine Linezolid Inhaled amikacin			
Susceptible	Resistant	Initial Phase ≥ 4	<i>Parenteral (choose 2-3)</i> Amikacin Imipenem (or ceftazidime) Tigecycline	<i>Oral (choose 2-3)</i> Azithromycin** Clofazimine Linezolid	Daily (3 times weekly may be used for aminoglycosides)	<40%
		Continuation Phase ≥ 2	<i>Oral/inhaled (choose 2-3)</i> Azithromycin** Clofazimine Linezolid Inhaled amikacin			

Weak Regimen!

*Azithromycin is active

**Azithromycin is unlikely to be active

Recommended Treatment Regimens *M. abscessus* – A Phased Approach

Macrolide Susceptibility						
Mutational	Inducible	No. of Drugs	Preferred Drugs		Frequency of Dosing	Treatment Success
Susceptible	Susceptible	Initial Phase ≥ 3	<i>Parenteral (choose 1-2)</i> Amikacin Imipenem (or ceftazidime) Tigecycline	<i>Oral (choose 2)</i> Azithromycin* Clotrimazole Linezolid	Daily (3 times weekly may be used for aminoglycosides)	> 80%
		Continuation Phase ≥ 2	<i>Oral/inhaled (choose 2-3)</i> Azithromycin* Clotrimazole Linezolid Inhaled amikacin			
Susceptible	Resistant	Initial Phase ≥ 4	<i>Parenteral (choose 2-3)</i> Amikacin Imipenem (or ceftazidime) Tigecycline	<i>Oral (choose 2-3)</i> Azithromycin** Clotrimazole Linezolid	Daily (3 times weekly may be used for aminoglycosides)	<40%
		Continuation Phase ≥ 2	<i>Oral/inhaled (choose 2-3)</i> Azithromycin** Clotrimazole Linezolid Inhaled amikacin			
Resistant	Susceptible or Resistant	As above				<40%

Weak Regimen!

*Azithromycin is active

**Azithromycin is unlikely to be active

Treatment Outcomes for *M. abscessus* vs. *M. massiliense*

Study	Population	Treatment	N	Sputum conversion	Failure to convert	Recurrence*
Koh, 2011	Non Cystic Fibrosis	<i>M. abscessus</i>	24	25%	58%	17%
		<i>M. massiliense</i>	33	88%	3%	9%
Lyu, 2014	Non Cystic Fibrosis	<i>M. abscessus</i>	26	42%	27%	31%
		<i>M. massiliense</i>	22	96%	0%	5%
Roux, 2015	Cystic Fibrosis	<i>M. abscessus</i>	12	25%	-	-
		<i>M. massiliense</i>	7	86%	-	-
Park, 2017	Non Cystic Fibrosis	<i>M. abscessus</i>	19	26%	74%	55%
		<i>M. massiliense</i>	17	82%	18%	0%

*Most recurrences are due to reinfection

Koh WJ, et al. Am J Respir Crit Care Med 2011;183:405-10
 Choi H, et al. Antimicrob Agents Chemother 2016 epub
 Park J, et al. CID 2017;64:301-8

Novel Treatments for NTM Infections

Repurposed Drugs

- Dual beta lactams \pm beta-lactamase inhibitors
- Cycline derivatives
- Rifabutin (for *M. abscessus*)
- Apramycin

New Drugs

- Epetraborole
- SPR720

New Formulations

- Inhaled tigecycline
- Inhaled clofazimine

Non-antimicrobials

- Inhaled NO
- Inhaled GM-CSF
- Gallium
- Bacteriophage

Mycobacterium abscessus and β -lactamase Inhibitors

- ▶ *Mycobacterium abscessus* produces a broad spectrum β -lactamase (Bla_{Mab})
 - ▶ Imipenem and ceftioxin are slowly hydrolyzed by Bla_{Mab} which contributes to their efficacy
- ▶ Inhibition of Bla_{Mab} by avibactam improves the efficacy of imipenem against *M. abscessus* *in vitro*, in macrophages and zebrafish embryos
- ▶ Combinations of beta-lactams have shown synergistic activity against *M. abscessus* *in vitro* and in mouse models

Model of *M. abscessus* Peptidoglycan

Lefebvre AL, et al. Antimicrob Agents Chemother 2017 epub
Dubee V, et al. Antimicrob Agents Chemother 2015;59:2938
Story-Roller E, et al. Antimicrob Agents and Chemother 2019;63:e02613-18

In vitro Activity Imipenem, Ceftaroline and Combination

- Imipenem and ceftaroline bind the same targets in peptidoglycan synthesis
 - Imipenem preferentially binds the transpeptidases and likely improves binding of ceftaroline
- Addition of relebactam did not increase activity beyond the combinations of the two beta-lactams

Cycline Derivatives

- ▶ Tigecycline has good activity against *M. abscessus* but is associated with high rates of nausea/vomiting (30-50%)
- ▶ Omadacycline is a newer cycline that comes in both oral and IV preparations and was approved by the US FDA for treatment of community-acquired bacterial pneumonia and skin infections in 2018
- ▶ Compared with tigecycline, nausea/vomiting are less frequent
 - ▶ nausea/vomiting occurred in 15%/8% of patients with the IV form and 25%/12% with oral dose
 - ▶ Much of the nausea/vomiting with the oral dose occurred during the loading dose that would not be necessary when treating NTM

In vitro Activity of Omadacycline, Tigecycline, and Eravacycline

Study	No. Isolates	Subspecies	Omadacycline		Tigecycline		Eravacycline

Activity of Epetraborole in *M. abscessus*

Pandemic Response Box:
Library contains 400 structurally diverse compounds (201 antibacterials, 153 antivirals, and 46 antifungals) for screening against infective and neglected diseases.

Epetraborole Has Similar In Vitro Activity as Clarithromycin Against *M. abscessus*

SPR720/SPR719

- ▶ SPR720 is an aminobenzimidazole, gyrase B inhibitor that is converted to SPR719 which is the active moiety
- ▶ In vitro, mouse model, and hollow fiber models have demonstrated activity against slowly growing NTM like MAC and *M. kansasii*
- ▶ The drug is formulated for oral administration
- ▶ Phase 1 study: well tolerated over 14 days, no SAEs

Activity of SPR719 Against NTM

NTM species	MIC range (mg/liter)	MIC ₅₀ (mg/liter)	MIC ₉₀ (mg/liter)
MAC (n = 73)	0.06–4	1	2
<i>M. kansasii</i> (n = 21)	<0.03–0.25	<0.03	0.125
<i>M. abscessus</i> (n = 32)	1 to >32	2	8
<i>M. simiae</i> (n = 4)	2–8	NA	NA
<i>M. malmoense</i> (n = 3)	0.06–0.5	NA	NA
<i>M. xenopi</i> (n = 5)	0.06–0.5	NA	NA

^aMAC, *M. avium* complex; NA, not applicable.

- Bacteriostatic activity against MAC and synergy with ethambutol
- Bactericidal activity against *M. kansasii*

Bacteriophage

- ▶ Bacteriophage - Virus that infect bacteria
- ▶ Phages are the most abundant organisms in the biosphere - 10^{31} phage with entire population turning over every few days
- ▶ Genomically, small, old and diverse
- ▶ Anecdotal reports of successful treatment for resistant microbes

Development and Use of Personalized Bacteriophage-Based Therapeutic Cocktails To Treat a Patient with a Disseminated Resistant *Acinetobacter baumannii* Infection

Mycobacteriophage Therapy for *M. abscessus*

- 26 year old man with cystic fibrosis
- Chronic MRSA and *Pseudomonas aeruginosa* infections
- Treated for MAC lung infection 5 years earlier
- *M. abscessus* subspecies *abscessus* isolated
- Treated with 4 to 5 drugs for over 4 years
- Remained culture positive with declining FEV1

Treatment Outcomes with Phage Therapy

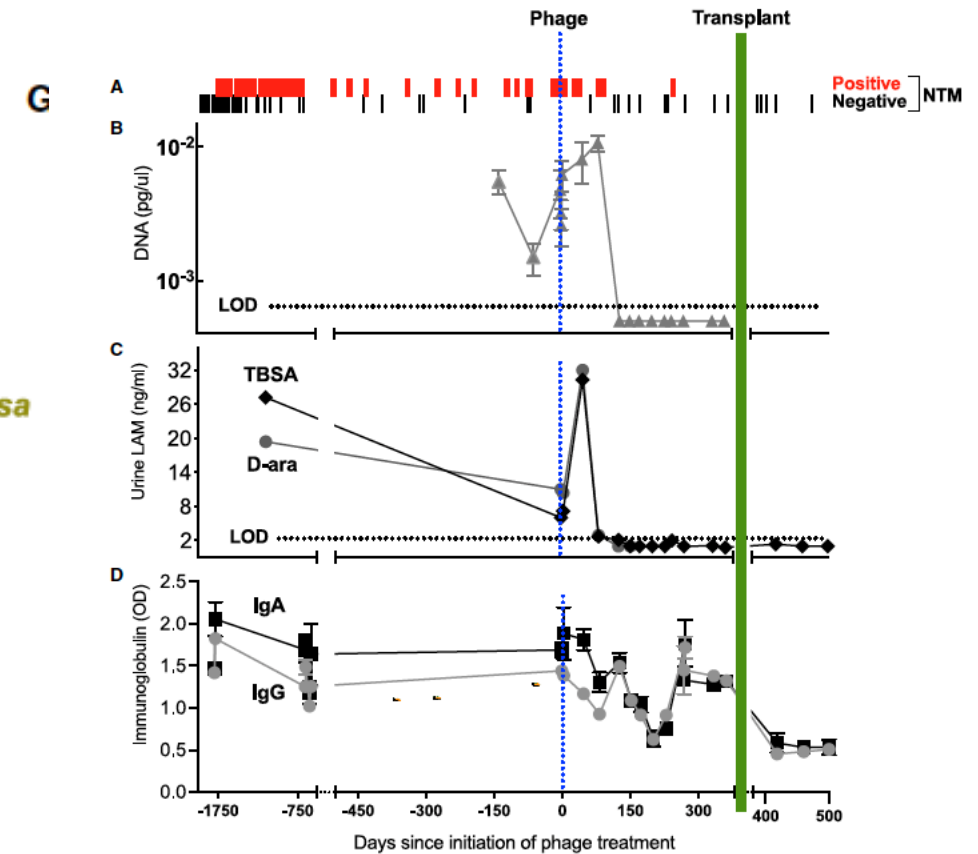

Radiographic Improvement

Culture Conversion

Biomarker Changes

Phage Therapy for Mycobacterial Infections in 20 Persons

- ▶ Isolates from 200 patients were screened for phage susceptibilities
 - ▶ One or more lytic phages were identified for 55 isolates
- ▶ Phage were administered intravenously, through inhalation or both in 20 patients with symptomatic mycobacterial infections
- ▶ Results:
 - ▶ No adverse reactions occurred
 - ▶ Favorable clinical or microbiologic responses were seen in 11 patients
 - ▶ Neutralizing antibody was identified in 8 patients possibly contributing to lack of treatment response
 - ▶ A single phage was administered in 11 patients and no phage resistance was identified

Drug Development Pipeline for NTM

Drugs: Phase 1-3

Phase 1

Gallium
Apramycin

Phase 2

Bedaquiline
Clofazimine
Epetraborole
IL-7
Inhaled GM-CSF
Inhaled nitric oxide
Omadacycline
SPR720

Phase 3

Amikacin liposome
inhalation suspension (ALIS)
RHB-204
Azithromycin vs clarithromycin
Clarithromycin vs moxifloxacin
2 vs 3 drugs for MAC
